

Frank Bolten, 2006

Managing Director, Sharp Electronics Germany/Austria

In the beginning, there was a dream. The dream of being able to hang a television set on the wall like a picture.

Generations of researchers searched for the solution and many viewers waited just as long for the chunky television set to disappear from the living room to make more room for movement. Only the invention of liquid crystal technology finally brought about the breakthrough. The beginning of a new millennium was also the start of probably one of the most important revolutions in entertainment electronics: the market introduction of the first flat television set. Consequently, more and more people are able to realise the dream of LCD TV.

Back to the picture. The television set of today can be mounted on the wall. But what if the set is off? A large black area decorates the most prominent area of the room.

Winfried Wolk's idea comes into effect here! He creates a wonderful symbiosis from art and high tech with his Display Paintings. A Sharp LCD TV as a frame needs the digital pictures, Wolk's art form needs a Sharp AQUOS.
